

UniNexus

An AI Academic Copilot for Smart University Management

UniNexus brings students, faculty and administrators onto one platform: an AI assistant that answers only from the university's own approved documents — and from each student's own notes and class materials — with sources shown for every answer, wrapped around a complete academic system of courses, classes, assessments, attendance, grades and communication. This guide describes every feature in plain language, grouped by who uses it. Verified against the working platform, July 2026.

Student Features

Students see only their own classes and their own data — every list, feed and answer is scoped to the sections they actually belong to.

Student Dashboard

The student's study hub: current courses, key numbers at a glance (courses, CGPA, saved answers, conversations), attendance rate, a daily study streak, recent conversations and the next few deadlines — all on one landing page.

AI Tutor Chat

The flagship feature. The student asks questions in everyday language and gets answers grounded in the university's approved documents plus their own notes and their classes' materials. Answers appear live, word by word, with numbered citations showing exactly where each fact came from, a confidence indicator, and suggested follow-up questions. Simple greetings get an instant friendly reply, and the student can pick a chat mode (academic, exam preparation, research, assignment help, career guidance or general) and an answer language.

Agent Mode — the tutor that acts

In Agent mode the tutor doesn't just explain — it can do things on the student's behalf: check upcoming deadlines, list their courses, look up and book (or cancel) a teacher's office-hours slot, generate a practice quiz or a flashcard deck, and add tasks to their planner. Every step is shown in the conversation as it happens, and every action follows exactly the same rules as clicking the buttons yourself — the AI can never do something the student couldn't.

Answers-Only Mode

One tap on the switch above the message box and the tutor becomes explanation-only. This is a real guarantee enforced by the platform itself — with the switch off, the ability to act is simply not given to the AI at all.

Chat Session Management

Conversations can be pinned to the top, renamed, archived for later or deleted, so the chat history stays organised across a busy term.

Saved Answers

A particularly useful answer can be saved into folders with a personal note, starred, and reopened later — with a link back to the original conversation and its sources.

Course Registration

Enrolment is a safe two-step process: the university places the student into specific class sections, and the student confirms with one click while the registration window is open. There is no free-for-all sign-up, no clashing sections, and a reserved seat is held until the student confirms. Dropping a class is equally simple.

Prerequisites

If a course requires other courses first, the registration page shows a clear met / not-met badge for each requirement, and the confirm button stays off until every prerequisite has been completed.

Section Waitlists

If an assigned class is already full, the student joins a first-come, first-served waitlist and can see their position in the queue. The moment a seat frees up, the person at the head of the queue is moved in automatically and invited to confirm.

Course Materials

All the learning resources published for the student's own classes, grouped by course — each one viewable, downloadable and markable as completed so progress is easy to track.

Document Library

A browsable library of the approved university documents the student is allowed to see — handbooks, policies, syllabi and more — with search, filters, preview, download and bookmarking.

My Documents

Students can submit their own documents into the university's review queue. Once a reviewer approves one, it becomes part of the knowledge the AI tutor can draw on.

Assignments & Submission

Every published assignment for the student's classes in one place, with due dates and status. Work is submitted as text, a file, or both, before the deadline — and once a submission has been graded it is locked, so the record is final.

Anonymous Peer Review

When a teacher turns peer review on for an assignment, each student who has submitted receives up to two classmates' submissions to rate and comment on — never their own, and anonymous in both directions. Reviewees see the feedback; the ratings never affect anyone's grade.

Class Tests

Timed quizzes set by the teacher, taken right in the platform with a live countdown. The security measures the teacher chose apply during the attempt, and the moment the student submits (or time runs out) the test is graded automatically and the result appears instantly.

AI Practice Quizzes

Students can quiz themselves any time: pick a topic, a number of questions and a difficulty, and the AI generates a fresh multiple-choice quiz. It is graded instantly with per-question explanations, can be retaken freely, and missed questions can be turned into flashcards with one click.

Practice from the Question Bank

Students can also build a practice quiz from the real questions their teachers have curated for the course — no AI involved at all, so it works for everyone, always.

Flashcards with Spaced Repetition

Personal study decks reviewed on a proven spaced-repetition schedule: after each card the student rates how well they knew it, and the system brings the card back right before they would forget it — so material sticks with less cramming.

AI Flashcard Generation

Instead of writing cards by hand, the student can name a topic and have a whole deck generated in seconds, then edit and review it like any other deck.

Notes

Personal notes, optionally tagged to a course and pinnable. Notes are private — and they are indexed for the AI tutor, so the student can literally ask questions about their own notes.

OCR Handwritten Notes

Snap a photo of a handwritten page and the AI transcribes it into clean, editable text, ready to save as a note — which then becomes searchable and answerable like everything else.

Tasks

Simple personal to-dos with a due date, priority and optional course, which also appear on the calendar.

AI Study Planner

Feed in the term's deadlines and the planner drafts a realistic study schedule, saving each chosen session straight into the student's tasks.

Transcript

Every course grouped by semester with its grade and credits, a GPA per semester, and an overall credit-weighted CGPA — always up to date, no office queue required.

Roadmap

A semester-by-semester view of degree progress: each course's instructor, status, grade and assignment completion, so the student can see where they are on the whole journey.

Attendance View

A clear per-course summary of the attendance their teachers have recorded, with an overall rate.

Exams View

The student's upcoming and past exams, with helpful countdown labels as each date approaches.

Calendar

One combined calendar of assignment deadlines, exam dates, personal tasks and booked office-hours meetings.

Calendar Export & Subscribe

The whole calendar can be downloaded, or subscribed to by link from Google, Outlook or Apple Calendar so it stays in sync automatically.

My Progress

A private analytics dashboard charting the student's own trends over time — GPA, attendance, test and assignment scores, and weekly activity. Nothing here is shared with anyone else.

Concept Mastery Map

A tile for every topic the student has actually studied, coloured by how well they know it — blended from their test results, practice accuracy and flashcard recall. Weak topics sort first, and each weak tile offers one-click buttons to generate a practice quiz or a flashcard deck on exactly that topic.

Leaderboard

An opt-in, gamified ranking. Joining earns XP for study activity — tests, submissions, attendance — deliberately kept separate from official grades. Students can compete under an alias, ranked by department, semester or section; those who don't opt in simply don't appear.

Discussion Feed

Every class has its own discussion group, joined automatically through enrolment. Students post, comment, like, and can report anything inappropriate; the teacher takes part and moderates.

Study Rooms

Classmates in the same section can spin up live group-chat rooms — one per topic, like a midterm prep squad — visible only to students actually in that class, with messages delivered in real time.

Office Hours Booking

Students see the bookable meeting slots published by their own teachers and book one in a click. First click wins — a slot can never be double-booked — both sides are notified, and the meeting lands on the calendar.

Anonymous Course Feedback

When a teacher opens a feedback window, the student can leave one anonymous rating and comment, revisable while the window is open. Responses are only ever shown to the teacher in aggregate, shuffled and unnamed — and not at all until enough students have responded.

Messaging with Faculty

Real-time private chat with the teachers the student shares a class with — online presence, typing indicators and unread counts included.

My Faculty Directory

A directory of the student's actual instructors, drawn from their enrolments, with a one-click way to start a conversation.

Profile & Settings

Edit name, bio and avatar, and manage personal preferences such as email digests.

Faculty Features

Teachers manage their classes end to end, with an AI assistant that drafts — and a teacher who always decides.

Faculty Dashboard

A teaching overview at a glance: courses and student counts, the grading backlog, how many students are currently at risk, AI usage and recent activity.

My Students Directory

A roster of the teacher's own students for the current term, with a direct entry point into messaging.

Messaging with Students

Real-time private chat with the teacher's own students — presence, typing indicators and unread counts included.

My Courses & Course Detail

The sections the teacher is assigned to, each with its roster, materials and assignments in one place.

Course Materials Management

Upload and manage learning resources for a taught class. Publishing notifies the class — and published files automatically become knowledge the students' AI tutor can answer from.

My Documents

Faculty can submit documents into the university's review queue, just like students; approved documents join the AI's knowledge base.

AI Teaching Assistant

A chat assistant for teachers on the same grounded, cited engine as the student tutor — with streaming answers — plus generators that draft quizzes, assignments and feedback in seconds.

AI Quiz Generation

Describe the topic and the assistant drafts a complete quiz. The teacher reviews and edits every question before anything is published — drafts are only ever drafts.

AI Assignment Generation

The assistant drafts a full assignment — tasks plus a grading rubric — for the teacher to shape and refine.

Publish Draft as Assignment

One click turns an approved draft into a real published assignment for the class, with students notified automatically.

Publish Draft as Class Test

Draft questions can equally become a real, timed, auto-graded class test — with whichever security measures the teacher chooses.

Attendance Management

Mark a whole class roster — present, absent, late or excused — for any date in seconds, with live class statistics.

Exams Timetable View

A read-only view of the official exam timetable relevant to the teacher's courses.

Class Test Authoring

Create timed multiple-choice and true/false tests for a taught class — instructions, duration, questions, marks and an optional availability window — writing questions by hand, pulling them from the question bank, or generating them with AI and editing.

Results & Attempt Review

A results screen shows every attempt with its score, status, warnings and risk level. For any attempt the teacher can open a full review dossier: what happened during the test, moment by moment, with any recordings and snapshot photos when those layers were on.

Risk Scoring

Each attempt receives a 0–100 risk score computed from what actually happened during the test — a triage aid that tells the teacher which attempts deserve a closer look. It is always a signal for human judgement, never an automatic verdict.

Proctoring Layer Selection

For every test, the teacher picks which security measures apply from the set the university has made available — from fullscreen enforcement and question shuffling up to webcam or screen recording, a face-liveness check that keeps questions hidden until a real, live face is confirmed, phone detection, and snapshot photo evidence at flagged moments. Camera analysis happens on the student's own device.

Grading

A per-assignment grading queue where the teacher enters a grade and feedback. The student is notified, and the grade flows straight through to their transcript.

AI Suggested Feedback

One click drafts strengths, areas to improve and a feedback comment for a submission — a starting point the teacher edits before saving.

AI-Assisted Rubric Grading

One click reads the actual submission and pre-fills a score and short justification for every rubric criterion, plus a suggested overall grade and feedback. Everything is an editable suggestion; the teacher reviews, adjusts and saves — nothing is ever released automatically.

Submission Similarity Screening

Every submission is quietly compared against classmates' work on the same assignment. Suspiciously similar pairs are flagged with the matching passages shown side by side — a review signal for the teacher, never an accusation or a penalty.

Peer-Review Averages in Grading

When peer review is on, the grading view also shows each submission's average classmate rating as extra context. It never counts toward the grade.

Question Bank

A shared, per-course library of reusable questions built by the faculty who teach it — add questions by hand or import them from past tests (duplicates skipped automatically), tag them by topic and difficulty, and reuse them term after term.

Draft Test from the Bank

Select questions from the bank and assemble them into a draft class test in one click, ready to review and publish.

Office Hours

Publish bookable meeting slots, see who has booked, and cancel when needed — with both sides notified and meetings on the calendar.

Course Feedback Windows

Open an anonymous mid-semester feedback window for a class and close it when done. Results — the average rating, the distribution and shuffled anonymous comments — unlock only once enough students have responded, so no response can be traced to a person.

AI Feedback Summary

One click distils all the anonymous comments into clear themes — what's going well, what concerns students, and what they suggest.

Faculty Analytics

Per-course (or all-courses) insight: enrolment, attendance rate, grade distribution, average scores and submission completion — the health of a class at a glance.

At-Risk Early Warning

Students who are slipping are flagged live on four signals — attendance, missed deadlines, test average and grade — at a High or Watch level, with a one-click message to reach out while intervention can still make a difference.

Assignment Management

Edit, publish, unpublish or delete assignments, and adjust details as the term evolves.

Peer Review Toggle

Peer review is a simple per-assignment switch — on for the assignments where classmate feedback helps, off everywhere else.

Discussion Participation & Moderation

Teachers take part in their own classes' discussion feeds and keep them healthy — pinning what matters and removing what doesn't belong.

Administrator Features

Admins govern people, structure, knowledge and the AI itself — with a live view of academic and operational health.

Admin Dashboard

A single overview of the institution: users, documents, activity, system health and student insights.

User Management

Create, edit, activate, deactivate and remove accounts, and assign roles. A deactivated person is signed out immediately and cannot log back in. One protected administrator account can never be deleted, deactivated or demoted — so the university can never lock itself out.

Role & Permission Matrix

A visual grid of 46 fine-grained permissions that can be switched on or off per role, so access always matches the university's own policies. Roles can also be granted temporarily, expiring automatically on a set date.

Course Catalog

The official catalogue of courses — create, edit and retire entries, each with its code, credits, department and year.

Course Prerequisites

Define which courses must be completed before another can be taken. The rule is enforced automatically at registration — no manual checking.

Sections & Student Assignment

Create the actual class offerings for a term, assign a teacher, set capacity, and place students into sections — the reserved seat then waits for the student's one-click confirmation. Full sections queue students on the waitlist automatically.

Terms & Rollover

Manage the academic calendar and close a term at its end: classes wind down, grades are locked in, and the next semester is promoted — the whole university rolls forward in one controlled step.

Registration Window

Open or close registration for the current term with a single switch.

Departments

Create, edit and remove the academic departments that people and courses belong to.

Document Library (All Statutes)

The complete admin view of every uploaded document, whatever its state — pending, approved, rejected or awaiting changes.

Document Approval Workflow

Every uploaded document passes through review: approve it, reject it with a reason, request changes, or discuss it in comments. Approval automatically makes the document part of the AI's knowledge; rejecting or editing it removes it from answers instantly. Every decision is recorded.

Exams & Timetable

Schedule official exams for courses; the affected students are notified automatically.

Exam Security Gate

The university-wide control over test proctoring: for each security layer, the admin decides whether teachers may use it at all and whether it is on by default for new tests. A built-in step-by-step guide explains exactly how each layer behaves — always reflecting the live settings, so the guide can never drift from reality.

AI Settings

The control panel for the AI itself: which provider to use (including a fully offline mode that needs no account or key), which models, how creative or precise answers should be, how many sources to consult per question, the minimum relevance for a source to count, an optional tone instruction, and the supported answer languages. The access key is stored securely and never shown back on screen.

AI Connection Test

A “Test connection” button that genuinely contacts the chosen AI service and reports whether it is reachable — before anyone depends on it.

Email Settings

Configure the university's outgoing email from the admin panel — no server access needed — and send a test email to confirm it works.

Platform Analytics

Institution-wide insight: usage, engagement, grade trends and the most-asked questions — a live picture of the running semester instead of an end-of-term report.

AI Usage Monitor & Access Control

See how much each person uses the AI, and block or restore an individual's AI access when needed — with the reason shown to them clearly.

System Monitor

A live, read-only health view of the platform — database, storage, background work and AI status.

Announcements

Broadcast a notice to any audience — the whole university, a role, or a department — with the ability to edit after sending.

Discussion Moderation Queue

A university-wide queue of reported posts and comments from every class discussion, so serious issues always reach an admin.

User Activity

A panel showing who visited the platform, where they came from, what device they used and their approximate location — with summary numbers, breakdowns, filters and a browsable feed. Records are kept only for a configurable period and cleaned up automatically.

Shared Capabilities

Available across roles — the connective tissue of the platform.

Sign-In with Role Selection

Everyone signs in with their email, password and role. The platform verifies the person actually holds that role before letting them in, and protects sign-in against repeated failed attempts.

Self-Service Signup

Students and faculty can create their own accounts; administrator accounts are created only by an administrator.

Demo Login

One-click sign-in to ready-made demonstration accounts, so the whole platform can be explored instantly.

Password Reset

The standard, secure email-based reset flow, with time-limited links.

Access Control Everywhere

Every page and every action checks both who you are and what you are specifically allowed to do — including roles granted only temporarily. Unauthorised attempts are turned away and recorded.

In-App Notifications

A live notification bell that tells exactly the right people about grades, new materials, assignments, exams, enrolment and announcements.

Email Digests & Deadline Nudges

A Monday-morning email summarising the week ahead — deadlines, fresh grades, booked meetings, flashcards due — plus a daily “assignment due soon” reminder. Anyone can opt out in Settings.

Real-Time Messaging & Presence

Private, live one-to-one chat between a student and a teacher who share a class — with online presence, typing indicators, unread counts and instant delivery.

Shared Discussion Feeds

Class discussions are one shared space for the students and the teacher of that class; admins can step into any of them when moderation requires it.

Global Search (§K)

One search palette, opened from anywhere, that searches by meaning across documents, notes, materials, courses, assignments, discussions and past AI conversations — always limited to what that person is allowed to see.

Public Document Library

A public, browsable library of openly shared files — viewable and downloadable without signing in.

Landing Page & Presentation

A public landing page introducing the platform, and a full-screen presentation mode for pitching it.

Legal Pages

Clear, public Terms of Service and Privacy pages.

Platform Engine

The machinery every role relies on — described here without the machinery talk.

Grounded Answers

The heart of UniNexus: when a document is approved it is broken into small passages and indexed; when someone asks a question, the most relevant passages they are allowed to see are found and handed to the AI as the basis for its answer. The AI answers from those sources — and says so honestly when they don't cover something — rather than inventing.

Chat with My Materials

A student's own notes (including scanned handwriting) and their classes' shared files are indexed through the same process, privately. Citations clearly label whether a source is a library document, a personal note or a course material — and personal content never appears anywhere it shouldn't.

Resilient AI with Automatic Fallback

The platform can run on several AI services, arranged in a chain: if the preferred one is unavailable or has no key configured, the next takes over, ending in a built-in offline mode that always works. The AI simply can never be down — and the whole product can be demonstrated with no accounts, keys or internet AI at all.

Resilient Document Search

The document-understanding side has its own independent fallback chain, so answers stay grounded even if one search backend fails.

Citations & Confidence

Every grounded answer carries numbered citations — down to the document — and a confidence indicator, so readers can judge and verify rather than merely trust.

Live Streaming Answers

Answers appear word by word as they are written, for students and faculty alike — fast, modern and transparent.

Consistent Knowledge Across Providers

The indexed knowledge is kept consistent with whichever AI service is active; switching services automatically rebuilds the index so answers never mix incompatible sources.

Demo Usage Cap

When the platform runs as a public demo, each account gets a fair, fixed allowance of AI requests across every AI feature — so a room full of curious visitors can't exhaust the shared budget. Normal deployments have no cap at all.

Maintenance Switch

An operator can put the entire platform behind a friendly “we'll be right back” page in seconds, and bring it back just as fast — no redeployment, no downtime engineering, and no way to accidentally lock themselves out.

Audit Trail

Important actions across the platform — approvals, grades, account changes and more — are recorded, so there is always an answer to “who did what, and when”.

Companion document: “UniNexus — Feature Index” lists all features by name for quick reference.
