

AI CORE · RETRIEVAL-AUGMENTED GENERATION

The AI never answers from memory.

Every answer is built from passages retrieved out of the institution's approved documents — and shown with its sources.

WHAT MAKES IT TRUSTWORTHY

- ▶ Answers come only from **approved institutional documents**
- ▶ Every claim cites its **document & page**, with a confidence score
- ▶ If the documents don't cover it, the AI **says so** — no guessing

PERMISSION-AWARE RETRIEVAL

The relevance search is **filtered by the user's role**, so two people asking the same question can get answers built from different sources.
A student literally **cannot retrieve** a passage they aren't allowed to see.

Why this beats a generic chatbot: ChatGPT answers from the open internet with no proof. UniGPT answers from **your university's approved documents**, cites the page, and respects who is allowed to see what.
